Chapter 1: Firm Heterogeneity and Racial Labor Market Disparities (Job market paper)

Black workers are more exposed to business cycle employment risk than white workers, even after adjusting for differences in industry and other cycle exposure factors. This paper introduces a new channel to explain the excess sensitivity of Black employment: employer heterogeneity in hiring practices. There are persistent differences in the hiring rates of Black and white workers across firms of different sizes. In an empirical decomposition, the behavior of small firms appears to contribute most to the *average* racial employment gap. Meanwhile, the change in the hiring gap at large firms contributes most to the *variation* in the racial employment gap over the business cycle. The second half of the paper introduces a search model with employer size-specific information frictions that captures these patterns. The abundance of available workers during downturns encourages firms to be more selective about the workers they hire. This can produce larger changes in hiring rates for the disadvantaged workers at firms with better screening technology.
